

Dear Hiring Team,

I am excited to apply for the Backend Developer position at Cineville. As a software engineer with experience in backend development, cloud technologies, and AI-powered applications, I am particularly attracted to the opportunity to contribute to a platform that combines technology with a meaningful cultural mission.

What stands out to me about Cineville is that technology is not the end goal, but an enabler. By helping people discover films and supporting independent cinemas across Europe, Cineville creates value beyond the software itself. The opportunity to contribute to CultureKit, a platform that serves cinemas, partners, and members across multiple countries, is especially appealing because it combines technical complexity with real-world impact.

In my professional experience, I have worked on backend systems, data-driven applications, and cloud-based infrastructure. Most recently, I contributed to the development of an AI-powered low-code platform that enables users to create applications and workflows through configurable agent pipelines. My work involved designing backend services, building REST APIs, orchestrating multi-step agent workflows, integrating LLM-powered components, and connecting services across different data sources.

One important part of this project was improving the reliability and consistency of generated applications. I worked on backend logic that translated user prompts into structured application definitions, including data models, page layouts, navigation behavior, styling options, and generated interface previews. I also helped improve the consistency between preview and live modes, so that generated applications behaved and appeared more reliably after deployment. This required careful attention to data structures, rendering templates, API behavior, and edge cases in generated model relationships.

This experience gave me a deeper understanding of designing systems that are flexible, maintainable, and reliable. Because users could describe changes in natural language, the backend had to interpret intent, update application configuration safely, and preserve existing functionality. I learned how important clear interfaces, predictable data models, robust validation, and well-structured service boundaries are when building software that other people depend on.

Working on agent-based applications also strengthened my appreciation for good software engineering fundamentals. While AI technologies evolve rapidly, I believe long-term value comes from building robust systems around them: clear APIs, reliable services, maintainable architecture, and thoughtful handling of failure cases. These are the same qualities that attract me to backend engineering. I enjoy solving problems behind the scenes, improving system reliability, optimizing data flows, and creating infrastructure that allows products and teams to move faster.

I am also excited by Cineville's technical environment. The combination of microservices, cloud infrastructure, APIs, and a growing international platform presents exactly the kind of engineering challenges that I want to work on. I enjoy collaborating with teammates, participating in code reviews, learning from more experienced engineers, and continuously improving my technical skills. At the same time, I value taking ownership of my work, communicating proactively, and following tasks through to completion.

Beyond the technical aspects of the role, I genuinely connect with Cineville's mission. I

have always enjoyed cinema, particularly science fiction films. What fascinates me about science fiction is its ability to explore the relationship between technology, society, and human nature. As someone working in software engineering and AI, I find these themes both professionally and personally inspiring. Whether it is a thought-provoking independent production or a larger-scale science fiction film, I appreciate how cinema can encourage curiosity and offer perspectives that challenge our assumptions.

This is one of the reasons why Cineville appeals to me. I admire your commitment to helping audiences discover films beyond what recommendation algorithms alone might surface. In a world increasingly shaped by technology, I believe there is real value in creating opportunities for people to encounter unexpected stories and ideas. I would be proud to contribute to the technology that supports that mission.

Thank you for your time and consideration. I would welcome the opportunity to discuss how my background, technical skills, and enthusiasm can contribute to Cineville's Development Team. I look forward to hearing from you.

Kind regards,

Ruike Yuan
